

# Leveraging Graph Neural Networks for Financial Fraud Detection: Practices and Challenges

**Yingtong Dou**

[ydou5@uic.edu](mailto:ydou5@uic.edu)

**Kay Liu**

[zliu234@uic.edu](mailto:zliu234@uic.edu)

**Philip S. Yu**

[psyu@uic.edu](mailto:psyu@uic.edu)

**University of Illinois Chicago**

**Machine Learning in Finance Workshop @ KDD 2022**

# Tutorial Outline

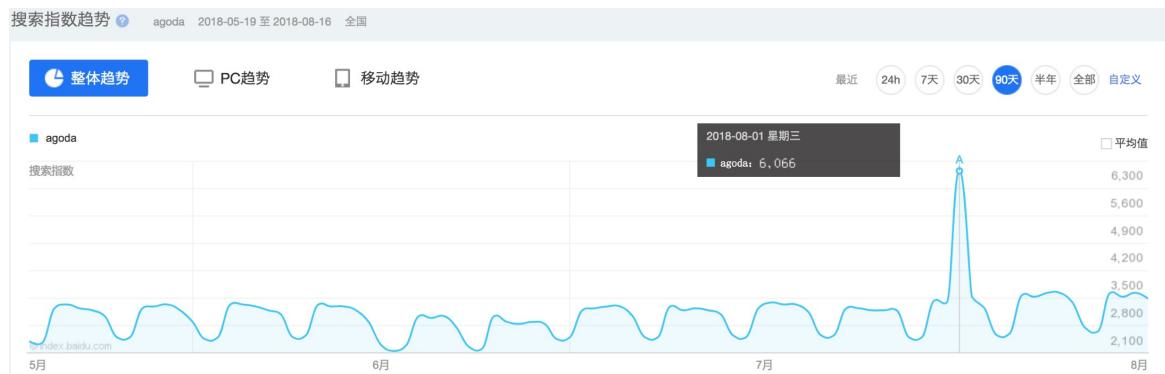

- **Part 1 & 2 (Yingtong)**
  - Background: Financial fraud detection and graph neural networks.
  - Supervised methods and DGFraud.
- **Part 3 & 4 (Kay)**
  - Unsupervised methods, PyGOD, and benchmark.
  - ML pipelines, and live demo.
- **Part 5 (Yingtong)**
  - Challenges, solutions, insights, guideline, and resources.

# Tutorial Outline

- Part 1 & 2 (Yingtong)
  - **Background: Financial fraud detection and graph neural networks.**
  - Supervised methods and DGFraud.
- Part 3 & 4 (Kay)
  - Unsupervised methods, PyGOD, and benchmark.
  - ML pipelines, and live demo.
- Part 5 (Yingtong)
  - Challenges, solutions, insights, guideline, and resources.

# What is Fraud?

- **Fraud definition according to U.S. Law:**
  - a misrepresentation of a fact, made from one person to another, with knowledge of its falsity and for the purpose of inducing the other to act.
- **Fraudster vs. Hacker**
  - Most fraudsters are **NOT** hackers.
  - Only few hackers are fraudsters.
- **Fraud vs. Anomaly**
  - Not all frauds are anomalies.
  - Not all anomalies are frauds.

# Machine Learning in Financial Fraud Detection

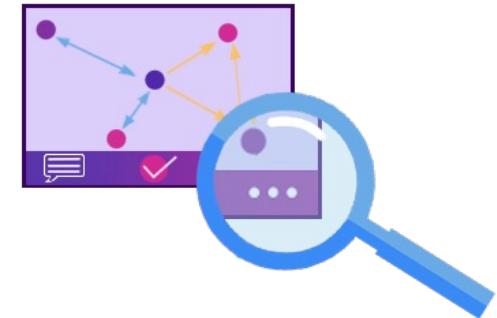

**Identity-based Detectors**

Demographical information

**Behavior-based Detectors**

The frequency of transaction

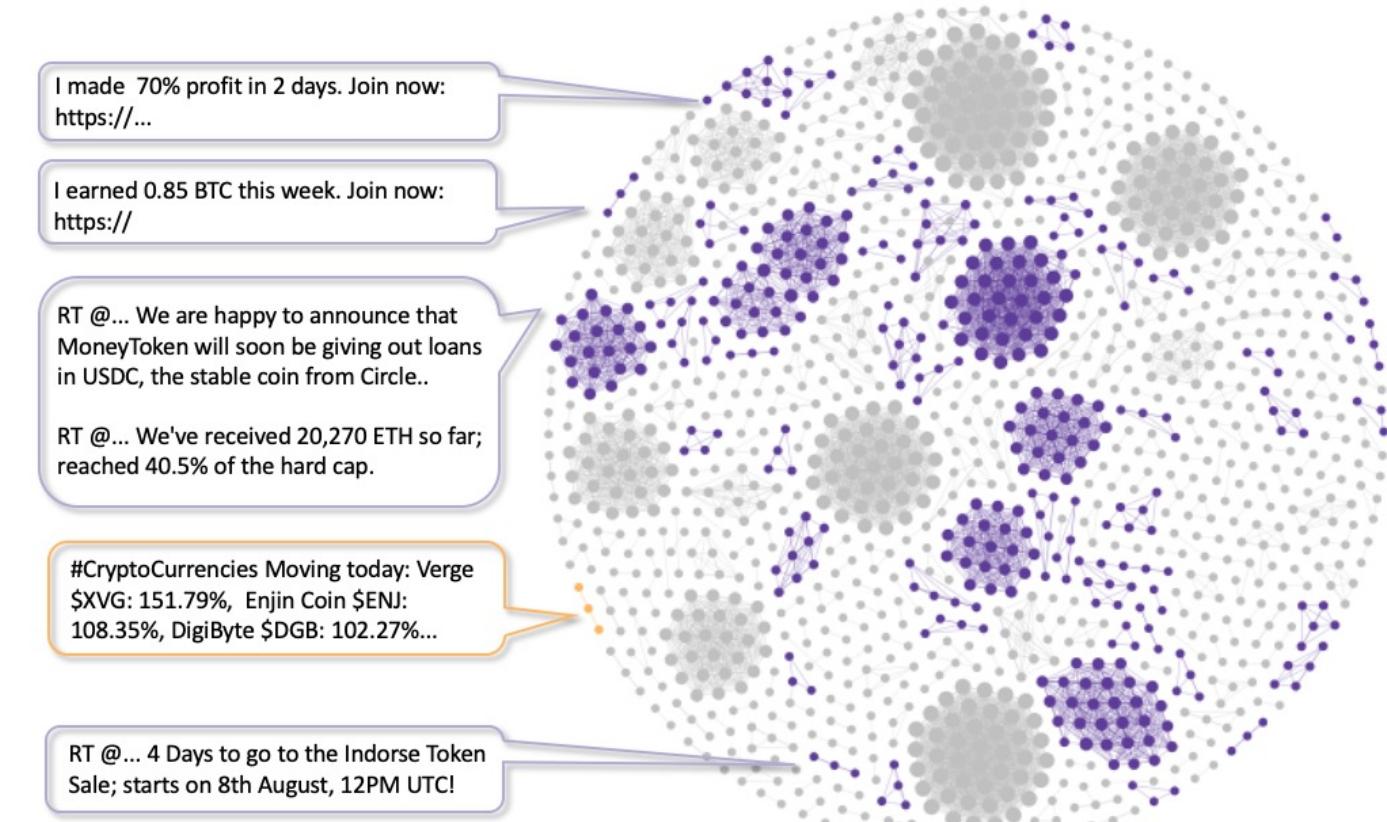

**Graph-based Detectors**

**Discuss in this tutorial!**

# Graph-based Fraud Detection

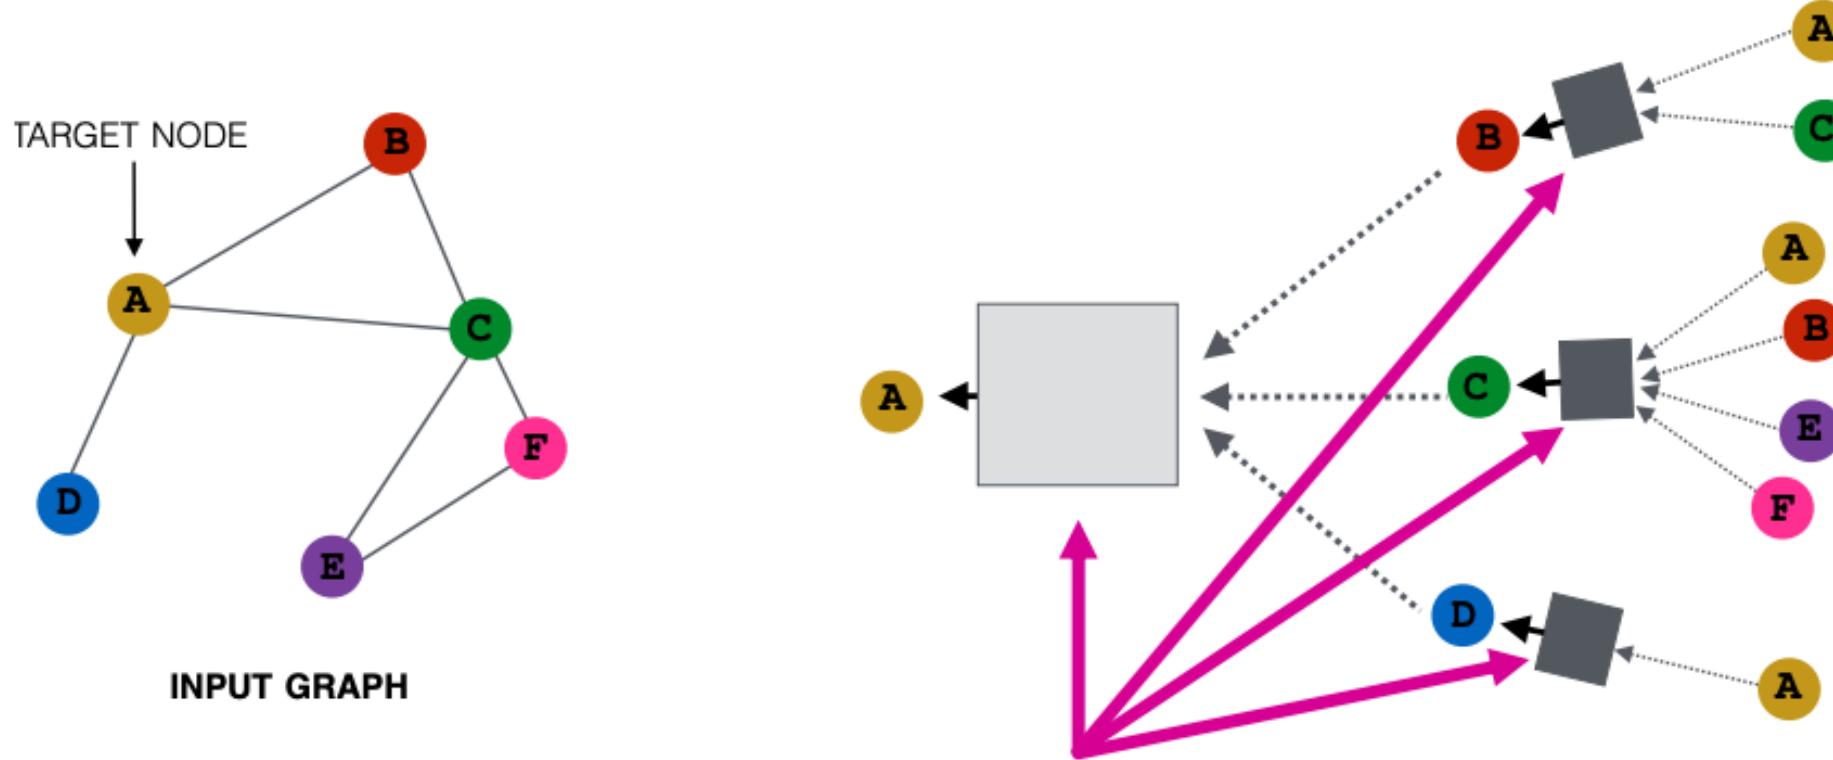

Bot Account on Twitter

Coordinated Accounts on Social Network<sup>[1]</sup>

# Graph Neural Networks

**Key idea: the connected nodes are similar (homophily assumption)**

# GNN Use Cases in Industry

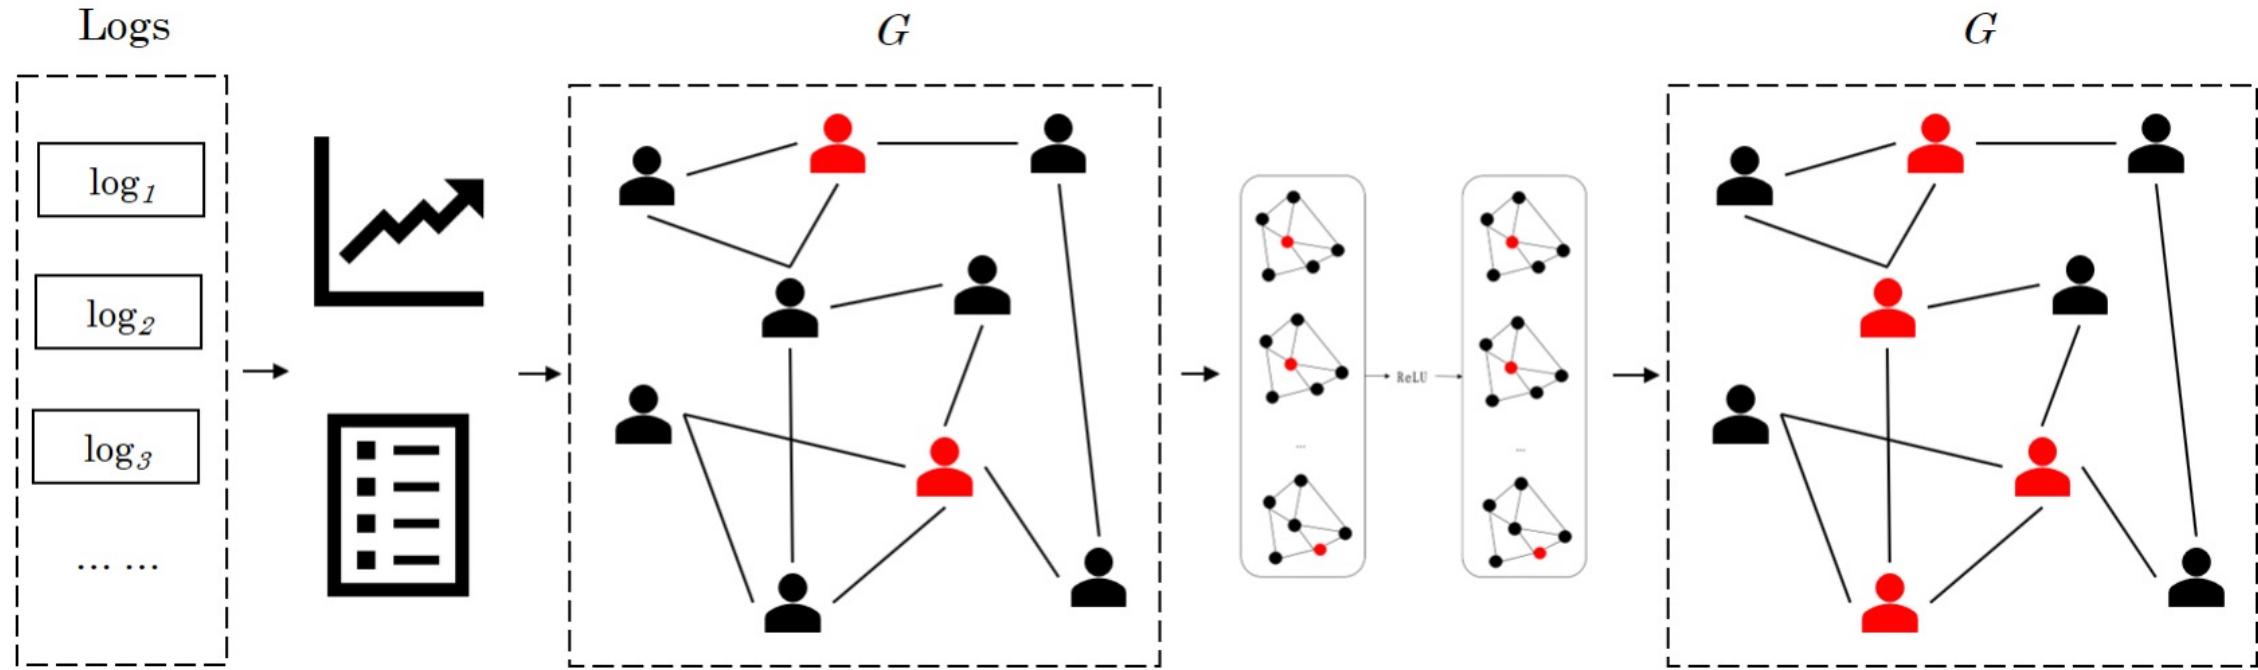

- Pinterest, Snapchat
  - Recommender systems
- Amazon & United Airlines
  - Information extraction
- AstraZeneca
  - Molecular Generation

- GNN for Financial Fraud**
- Insurance Fraud
  - Loan Defaulter
  - Money Laundering
  - Credit Card Fraud
  - Transaction Fraud
  - Cash-out Fraud
  - Bitcoin Fraud

# Tutorial Outline

- Part 1 & 2 (Yingtong)
  - **Background: Financial fraud detection and graph neural networks.**
  - **Supervised methods and DGFraud.**
- Part 3 & 4 (Kay)
  - **Unsupervised methods, PyGOD, and benchmark.**
  - **ML pipelines, and live demo.**
- Part 5 (Yingtong)
  - **Challenges, solutions, insights, guideline, and resources.**

# Supervised GNN

(1) Graph Construction.

(2) Training GNN on the Graph  
with labeled nodes.

(3) Classifying Unlabeled Nodes.

# GEM (CIKM'18)

Blue: normal accounts

Yellow: malicious accounts

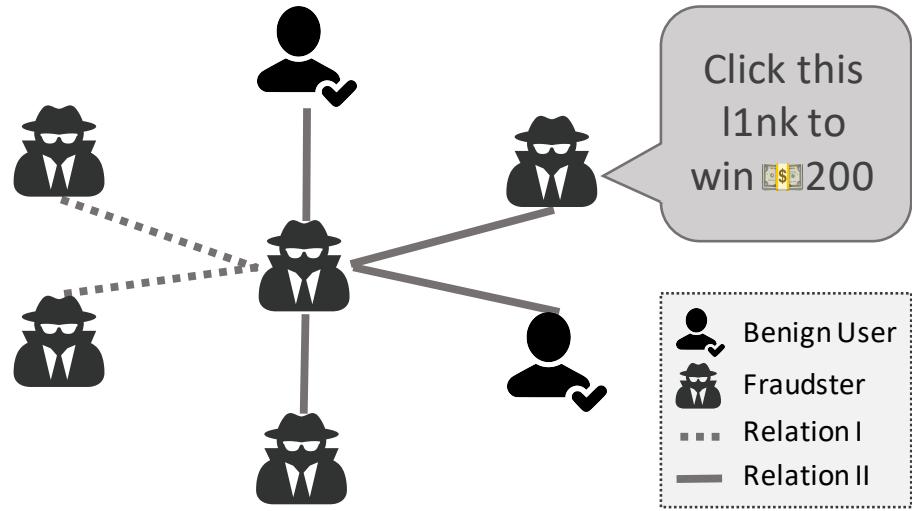

Other: different devices

Account-Device  
Heterogeneous Graph

- Task: malicious accounts detection in mobile payment service (Alipay).
- **The first paper leveraging the heterogeneous graphs for fraud detection.**
- Device types include UMID, MAC address, IMSI, APDID (Alipay Fingerprint).
- Code is [available](#).

# CARE-GNN (CIKM'20)

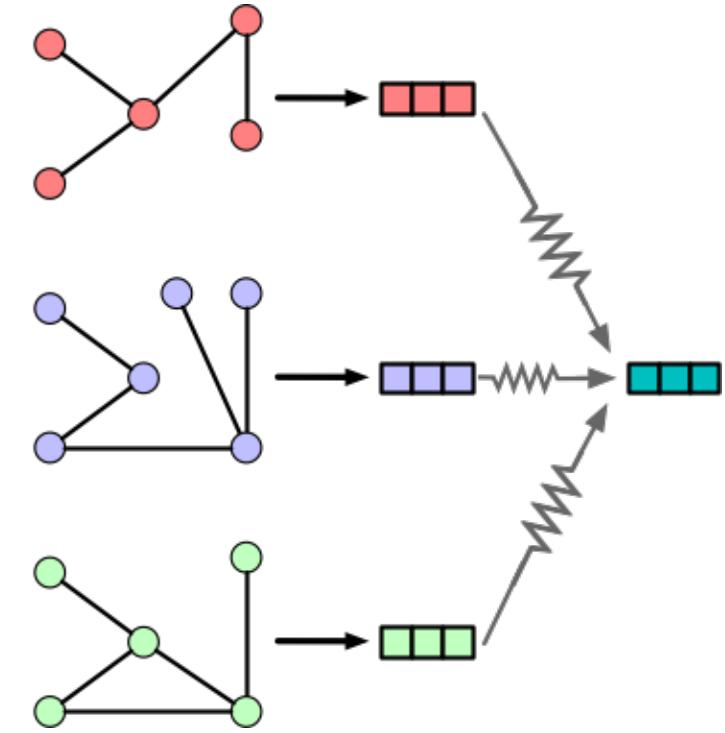

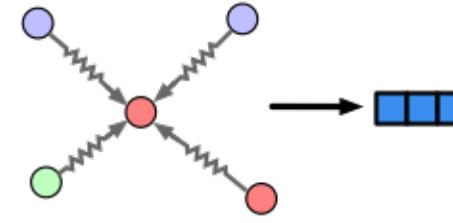

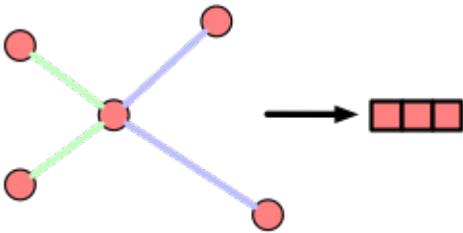

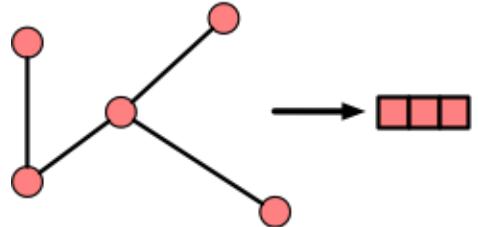

Fraudster Camouflage  
&  
Multi-relational Graph

- Task: spam review detection on Yelp; malicious reviewer detection on Amazon.
- **Top 10 influential papers in CIKM'20.**
- Using reinforcement learning to select the most informative neighbors for GNNs.
- Code is [available](#).

Background

[mHGNN](#)  
[IHGAT](#)

## Hierarchical

[GEM](#)  
[SemiGNN](#)  
[Player2Vec](#)  
[AA-HGNN](#)

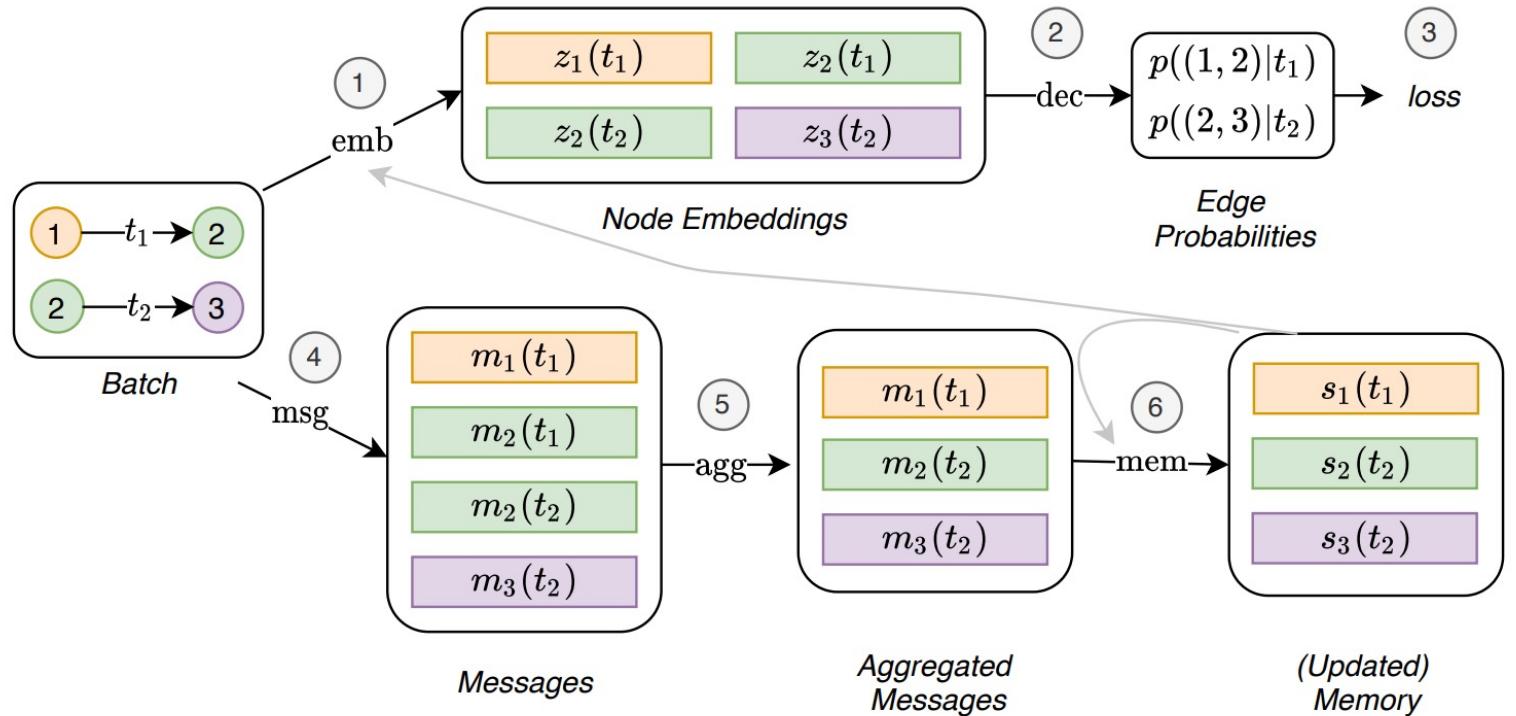

# Graph Schema is Crucial

- Task: finding fraud colluders on an online insurance platform.
- The suspicious signal can only be visible under certain graph schemas.
- Graph schema design is the key step for applied graph machine learning.

# Dynamic GNN: A Low-latency Inference Solution

- Each node has a mailbox (memory) to store the up-to-date neighbor information.
- The inference can be done by aggregating information from the memory.
- The memory can be updated asynchronously.
- APAN: e-commerce transaction fraud detection.

# DGFraud

- **DGFraud – A Deep Graph-based Toolbox for Fraud Detection.**

build passing license Apache-2.0 release v0.1.0 PRs welcome

build passing tensorflow 2.X python 3.6 | 3.7 | 3.8 | 3.9 PRs welcome release v0.1.0

# Tutorial Outline

- Part 1 & 2 (Yingtong)
  - **Background: Financial fraud detection and graph neural networks.**
  - **Supervised methods and DGFraud.**
- Part 3 & 4 (Kay)
  - **Unsupervised methods, PyGOD, and benchmark.**
  - **ML pipelines, and live demo.**
- Part 5 (Yingtong)
  - **Challenges, solutions, insights, guideline, and resources.**

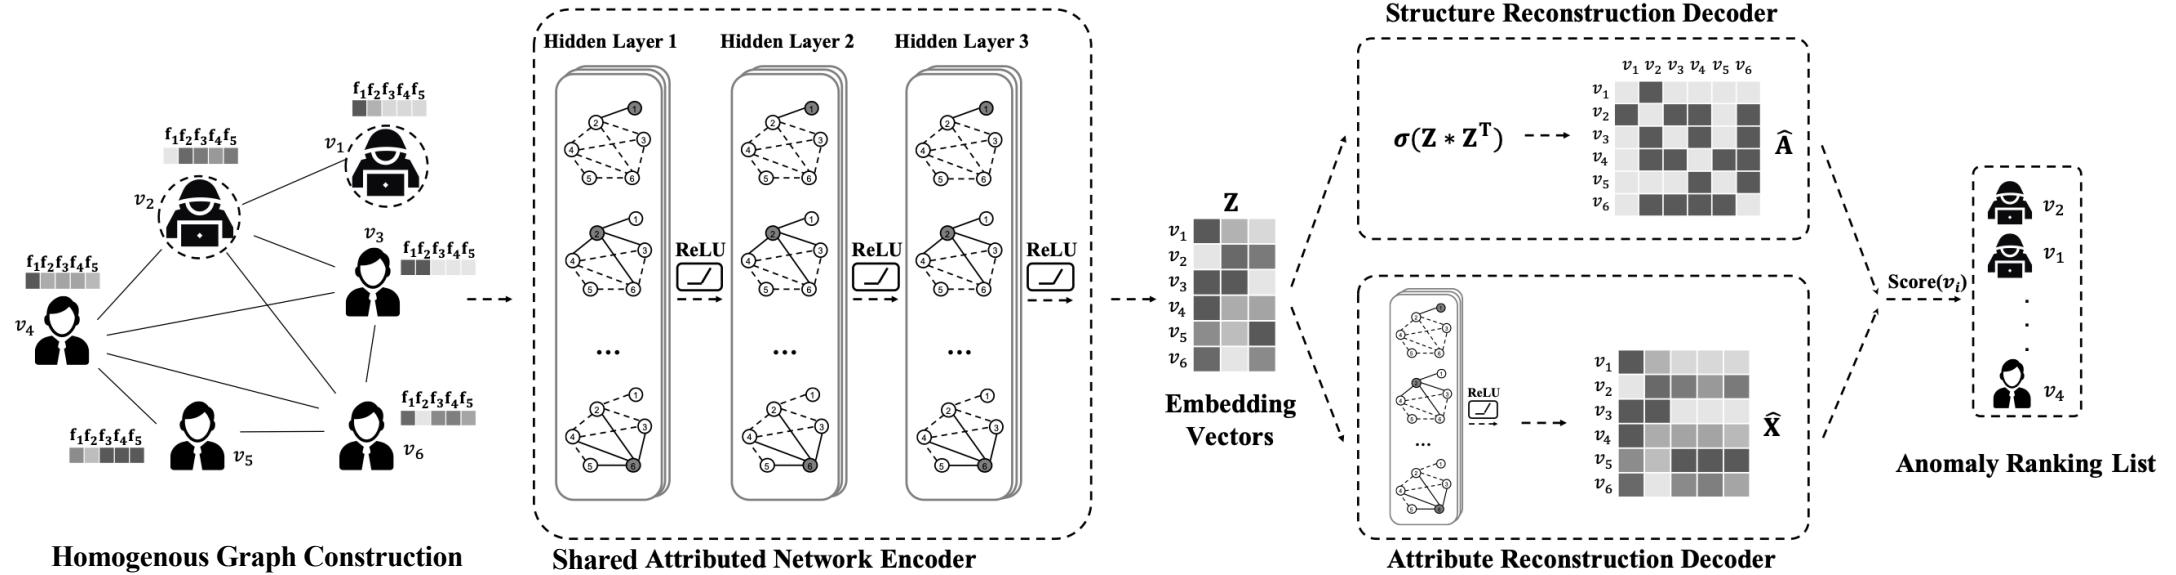

# Unsupervised Fraud Detection with Graphs

- **Label scarcity**
  - Ground truth labels can be expensive, even impossible to obtain.
- **Novelty detection**
  - Unsupervised learning does not rely on existing labeled data.
- **Preprocessing for downstream tasks**
  - E.g., Outlier resistant node classification.

# Graph Auto-Encoder (GAE)

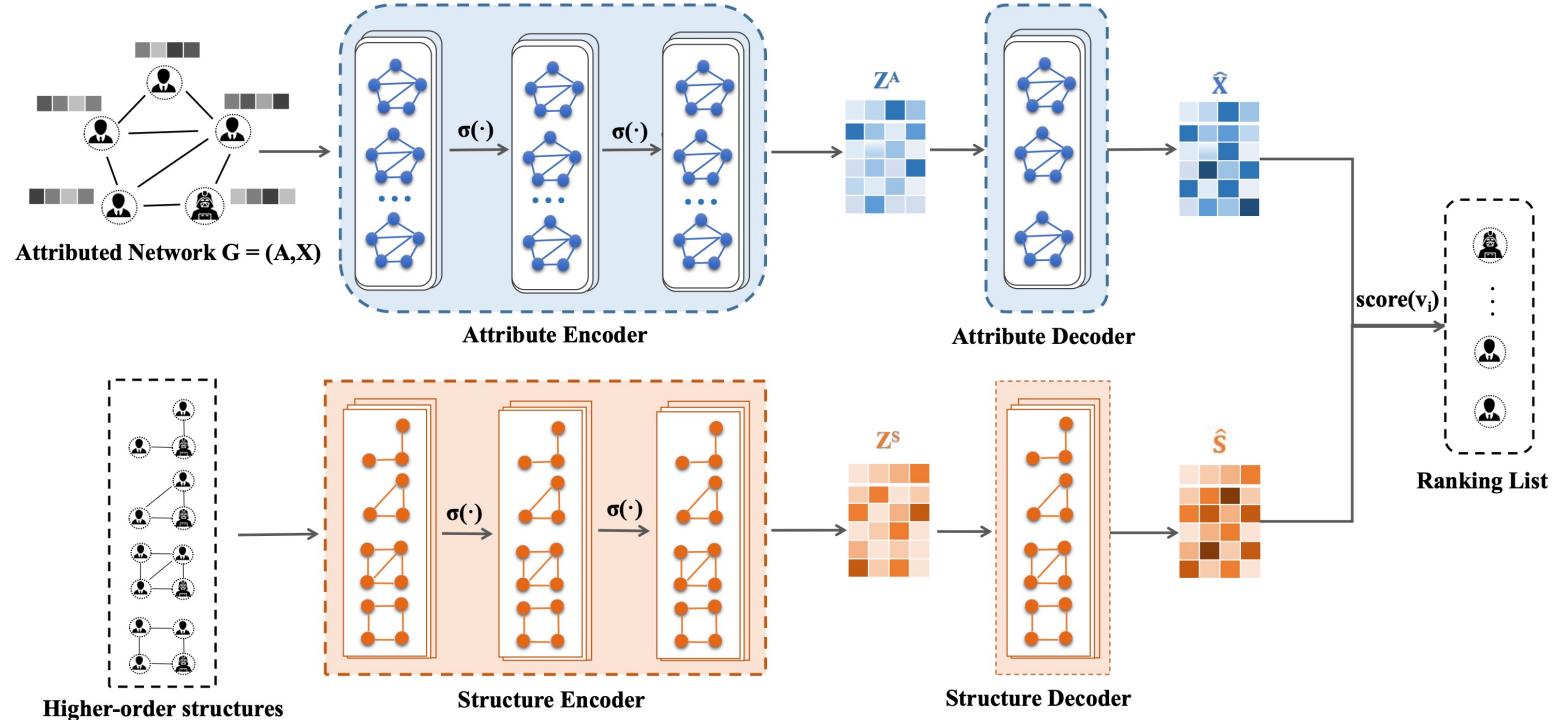

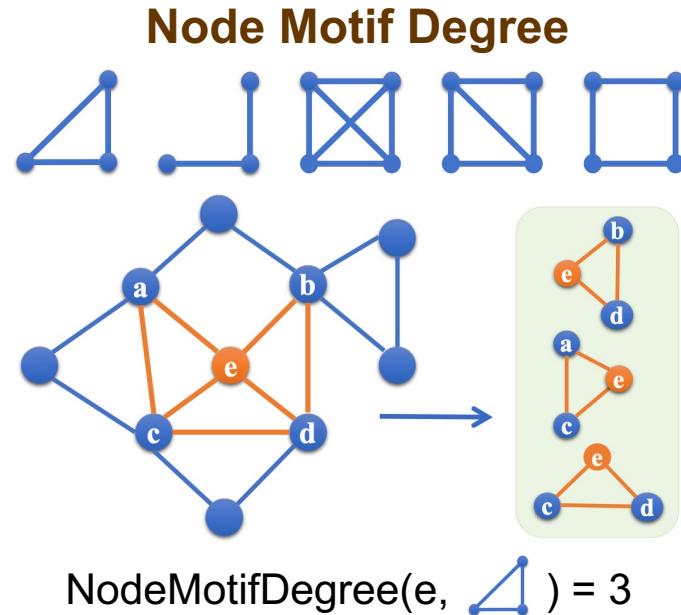

# DOMINANT (SIAM'19)

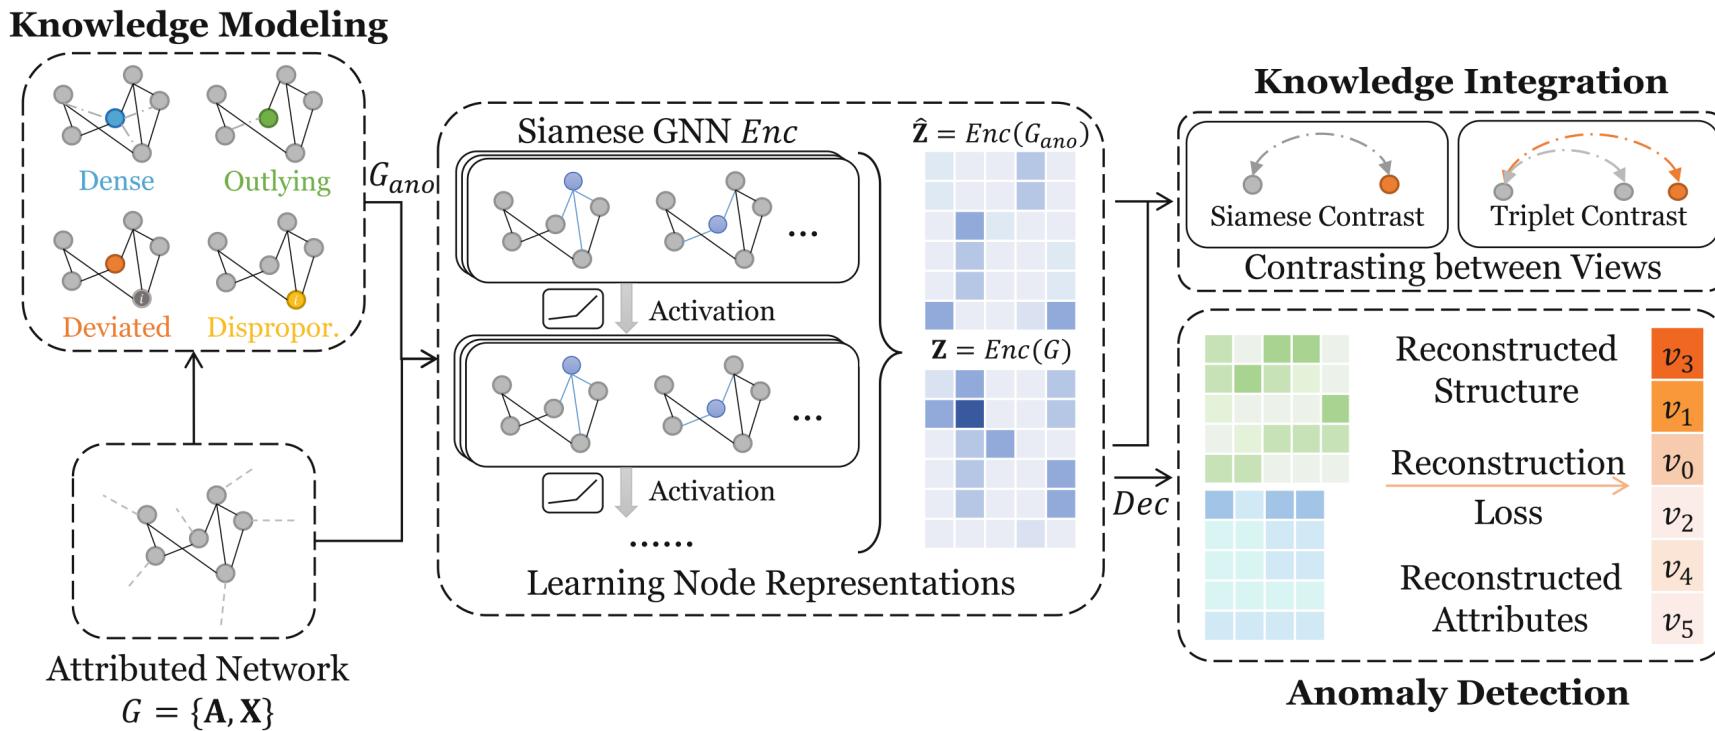

- The first attempt of **graph auto-encoder** in graph anomaly detection problem.
- Adopted **multi-task learning** framework to jointly detect anomalies from two aspects.
- Using **reconstruction error** of structure and attribute as anomaly score.

# GUIDE (Big Data'21)

- Capture higher-order structure information with **node motif degree**.
- Largely improve the scalability for AE, but **huge burden** on node motif degree counting.
- **Imprecise estimate** (e.g., [LRP](#)) can accelerate node motif degree counting.

# CONAD (PAKDD'22)

- Data augmentation with predefined anomaly **knowledge modeling**.
- Applying **contrastive learning** in graph anomaly detection problem.
- Knowledge integration with **Siamese Contrast** and **Triplet Contrast**.

'gen_10000'	generated	10,000	49,614	64

# Benchmark on Performance

- Deep graph-based methods are generally better than others.
- No algorithm outperforms on all datasets in expectation.
- Performance on synthetic outliers may not generalize to organic outliers.
- Trade-off between algorithm stability and potential.

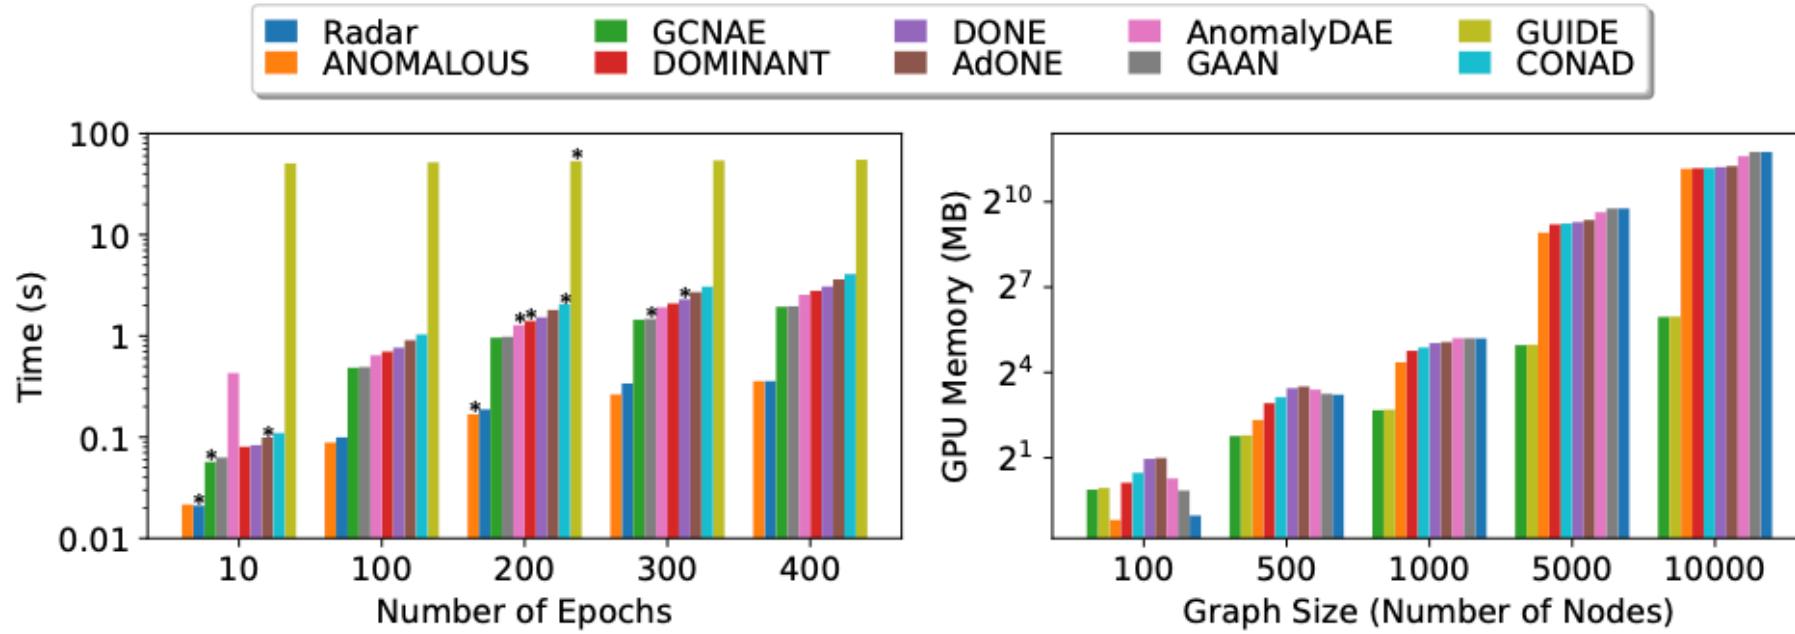

# Benchmark on Outlier Types

- The **reconstruction** instead of neighbor aggregation detects structural outlier.
- **Low-order structure** is sufficient for detecting structural outlier.
- None of the methods **balances** multiple types of outliers well.

# Benchmark on Efficiency and Scalability

- Conventional methods are more efficient than deep methods.
- GUIDE improves scalability at an expense of efficiency.

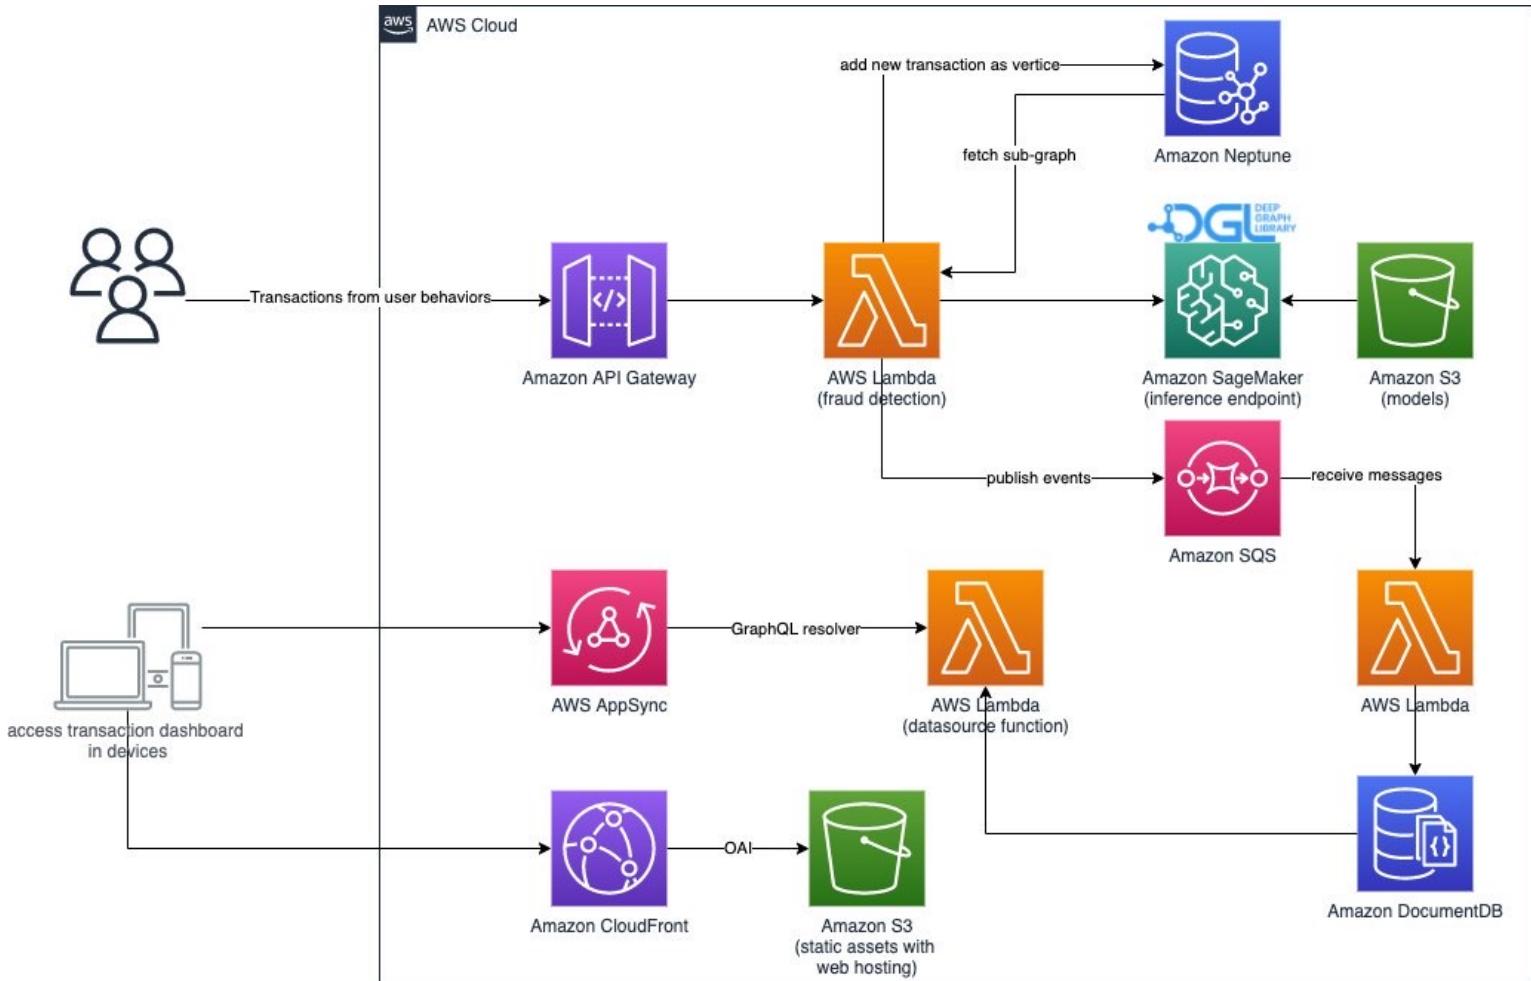

# Tutorial Outline

- Part 1 & 2 (Yingtong)
  - **Background: Financial fraud detection and graph neural networks.**
  - **Supervised methods and DGFraud.**
- Part 3 & 4 (Kay)
  - **Unsupervised methods, PyGOD, and benchmark.**
  - **ML pipelines, and live demo.**
- Part 5 (Yingtong)
  - **Challenges, solutions, insights, guideline, and resources.**

# AWS DGL Real-time Fraud Detection Solution

- Processing a tabular transaction dataset into a heterogeneous graph dataset.
- Training a GNN model using SageMaker.
- Deploying the trained GNN models as a SageMaker endpoint.
- Real-time inference for incoming transactions.

# TigerGraph Machine Learning Workbench

## Development Framework for Graph Machine Learning

Enables data scientists to create graph neural network models and graph-enhanced models with production scale data.

## Python-level Functions and Capabilities

Prepackaged Python libraries for graph data processing, graph feature engineering, subgraph sampling, data loading, and caching for out-of-DB training. No GSQQL experience is required.

## Compatible with Popular Machine Learning Frameworks

Work with the most popular machine learning frameworks in the market including PyTorch Geometric and DGL.

## Plug-and-Play Ready Machine Learning

Flexible integration paths to works with your existing machine learning infrastructure on Amazon SageMaker, Google Vertex AI, and Microsoft Azure Machine Learning.

# Tutorial Outline

  - Challenges, solutions, insights, guideline, and resources.

# GNN Financial Fraud Detection Papers

- **Online/Mobile Payment Fraud**
  - [CIKM'18](#), [ICDM'19](#), [AAAI'19](#) (cash-out).
- **Insurance Fraud**
  - [SIGIR'19](#).
- **Blockchain/Crypto Fraud**
  - [MLF@KDD'19](#), [WWW'22](#).
- **Loan Defaulting, Loan Fraud**
  - [CIKM'20\(1\)](#), [CIKM'20\(2\)](#), [AAAI'21](#), [WSDM'21](#), [WWW'21](#), [SDM'21](#), [arXiv'22](#).
- **Transaction Fraud (e-commerce and credit card)**
  - [arXiv'20](#), [SIGMOD'21](#), [KDD'21](#), [WISE'21](#), [TOIS'21](#), [ESA'22](#), [KDD'22](#).

# Key Challenges and Solutions

- **Camouflage**
  - Neighboring filtering: [SIGIR'20](#), [CIKM'20](#), [WWW'21](#).
  - Aware of adversarial behavior: [IJCAI'20](#), [WWW'20](#).
  - Active generative learning: [ACL'20](#).
  - Bayesian edge weight inference: [ACL'21](#).
- **Scalability**
  - GNN scalability: [MLF@KDD'20](#).
  - Shallow graph models are more scalable: [MLG@KDD'18](#), [WWW'20](#).
- **Class imbalance**
  - Under-sampling: [CIKM'20](#).
  - Neighbor selection: [WWW'21](#).
  - Data augmentation: [CIKM'20](#).

# Key Challenges and Solutions (Cont'd)

- **Label scarcity**
  - Active learning: [ICDM'20](#), [TNNLS'21](#).
  - Ensemble learning: [CIKM'20](#).
  - Meta learning: [WSDM'21](#).
- **Label fidelity**
  - Active learning: [TNNLS'21](#).
  - Human-in-the-loop: [AAAI'20](#).
- **Data scarcity**
  - Data augmentation: [CIKM'20](#), [CIKM'21](#), [ACL'20](#).

# Novel Practices

- **Graph Pretraining (Contrastive Learning)**
  - Fraudster is distinguishable from its structural pattern.
  - [TNNLS'21](#), [SIGIR'21](#), [arXiv'21\(1\)](#), [arXiv'21\(2\)](#).
- **Dynamic/Temporal/Streaming Graph**
  - Historical information is useful for identifying fraudsters.
  - Efficiency and cost are bottlenecks.
  - [CIKM'21](#), [KDD'21\(1\)](#), [KDD'21\(2\)](#), [SIGMOD'21](#).
  - [arXiv'21](#), [SDM'21](#), [ICDM'20](#), [KDD'20](#).
  - [ROLAND \(KDD'22\)](#), [arXiv'22](#).

# Novel Practices (Cont'd)

- **Multi-task Learning**
  - Credit limit forecasting and credit risk predicting: [WSDM'21](#).
  - Fraud detection and recommender system: [SIGIR'20](#).
- **Explainable Fraud Detection**
  - Explainable fraud transaction detection: [arXiv'20](#), [KDD'21](#).
  - Explainable fake news detection: [ACL'20](#).
- **Table2Graph**
  - Transforming credit card fraud tabular data to graph data: [IJCAI'22](#).

# Insights and Discussions

- Early detection, prevention vs. detection.
- Integrating knowledge graph (external knowledge).
- The longtail distribution of the fraud types.
- The concept drift and continual learning.
- The gap between academia and industry.

# Applying GNNs in Fraud Detection: A Guideline

## • Using Graph?

- The fraudsters share common properties.
- The fraudsters have clustering behavior.
- The trade off between cost and effectiveness.

## • Using GNN?

- The infrastructure.
- The feature availability and feature types.
- Integrating with other modules and tasks.

## • Which Task?

- Supervised:
  - Node/edge/graph/subgraph classification.
- Unsupervised:
  - Community detection; anomaly detection.

## • Schema Design

- Node/edge type and node/edge feature.
- Graph schema, node sampling.
- Graph structure is flexible: [SIGIR'19](#), [ICDM'20](#).

## • Which GNN?

- GNN is chosen based on task and schema.
- Simple GNN model is enough.
- Dynamic GNNs need more efforts.
- GAT and Graph-SAGE are commonly used.
